Are you still using a manual toothbrush to brush your teeth? That is so last century! Time to make the change to electronic toothbrush. It is not just any electronic toothbrush: you must try the BP iBright sonic toothbrush with the cutting edge wavelength light therapy technology that manages oral health better.

Dentistry clinical studies prove that BP iBright helps prevent and treat gingivitis, strengthen gums and make teeth whiter. Thanks to the revolutionary technology behind this electronic toothbrush that uses red and blue light modes that work in synergy to clean and heal teeth and gums, which has never been done before until now.

This is how it works:

Studies have shown that the red and blue lights have specific properties. Red light hastens healing and has anti-inflammatory effect which is excellent for treating gingivitis and soothing gums. Blue light on the other hand, has been scientifically proven to whiten teeth and kill bacteria. When red and blue lights are used in a dual light mode, the combination of these two colours emits a purple light which produces the benefits of both. In other words, the purple light will whiten, clean teeth, heal and soothe gums!

The best toothbrush head for removing plaque and debris from the teeth is one with soft bristles and a small head. This is recommended by most dental professionals. The BP iBright toothbrush head uses microfibre brush which is soft and replaceable. It helps to loosen and remove plaque by vibrating at 12,000 – 24,000 RPM, without causing harm to the tooth surface. The design of the small head also helps to reach all areas of the oral cavity, especially the hard-to-reach back teeth. This powerful toothbrush is very light and comes with a micro USB charging port. It is easy to pack and can be used anywhere and anytime!
